78-x86.exe (15.50 MB). RenWin is a series of thin client software for Windows and Linux for company users. The software simulates Windows 7 operating system and allows you to access shared network resources from anywhere by using the Internet. It has different functions, for example: Remote Desktop, file manager, browser etc. Its design is simple and easy to use. Q: PHP fputcsv - specifying a different delimiter I have a code that seems to work, but I have two problems: When using a file handle instead of a variable, fputcsv prints the first row with ctrl-L instead of the default value, the quote character. When using fputcsv(fopen(\$handle, 'r'), array('name' => 'ID')) I get an error Warning: fputcsv(): delimiter must be a character in /path/to/php/file.php on line 10 In my case, the first row is: Name (hidden), ID, X coordinates, Y coordinates, X speed, Y speed For debugging, I simply wrote the CSV file with the code, and the first row doesn't print any more. So it seems to be something with the ctrl-L char. I would really like to know how I could output the row with the proper delimiter, otherwise it seems to be a

minor problem, but I'd like to make sure it's fixed. A: You can use a different delimiter via the "delim_str" parameter. So the fputcsv documentation says: The delim_str parameter specifies the character(s) used to separate values and should be a string (either a single character or a string) that does not contain the delimiter character used to separate values in the data passed to the fputcsv() function. Here's a PHP example: \$fp = fopen(\$filename, 'w'); fputcsv(\$fp, array('Name (hidden)', 'ID', 'X coordinates', 'Y coordinates', 'X speed', 'Y speed')); fclose(\$fp); Or as a part of the code above: Here's a different delimiter, which looks 82157476af
